Exercise – 4- CPU Scheduling Algorithms-II

Lab Exercise 4: Implementation of CPU Scheduling Policies: Round Robin and Priority (Non-preemptive and Preemptive)

Objective:

Develop a menu driven C program to implement the CPU Scheduling Algorithms

Priority (Non-Preemptive and Preemptive) and Round Robin

Sample Learning Outcome:

1. Implement the various CPU scheduling algorithms like RR and Priority Scheduling (P and NP)
2. Calculate the waiting time, response time and turn around time for various scheduling algorithms
3. Based on criteria, identify the best scheduling policy

Best Practices:

1. Algorithm design
2. Naming convention – for file names, variables
3. Comment usage at proper places
4. Prompt messages during reading input and displaying output
5. Error handling mechanisms for input like burst time, starting time,
6. Incremental program development
7. Modularity
8. All possible test cases in output

Algorithm:

1. Read the following
 - a. Number of processes
 - b. Process IDs
 - c. Arrival time for each process
 - d. Burst Time for each process
2. Design a menu with Priority and Round Robin options
3. Upon selection of menu option apply the corresponding algorithm.
4. Compute the Turnaround Time, Average waiting Time for each of the algorithm.
5. Tabularize the results.
6. Display the Gantt Chart.

Sample Input & Output:

CPU SCHEDULING ALGORITHMS

1. ROUND ROBIN
2. PRIORITY
3. EXIT

Enter your option: 1

ROUND ROBIN CPU SCHEDULER

Number of Processes: 5

Process ID: P1

Arrival Time: 0

Burst Time: 4
